

DIGGS File Inspector — Lithology Pattern Reference

Every fill pattern in the graphic lithology log, with the USCS groups, classification names and description keywords that route to it. Soil = 26 USCS (ASTM D2487) groups and rock patterns are recreated from FGDC tiles. Fully vector.

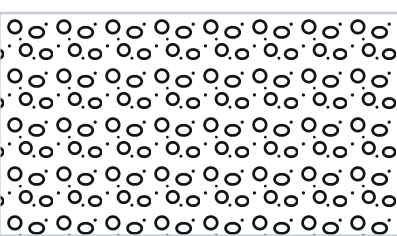

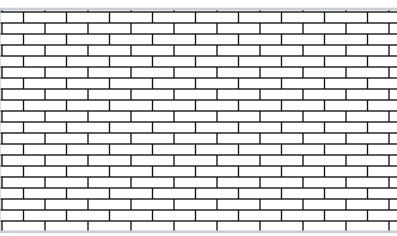

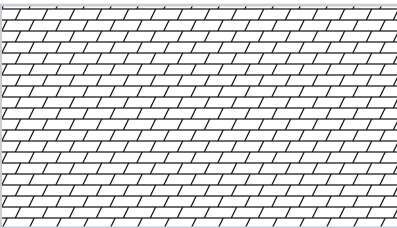

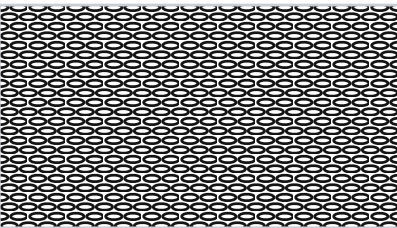

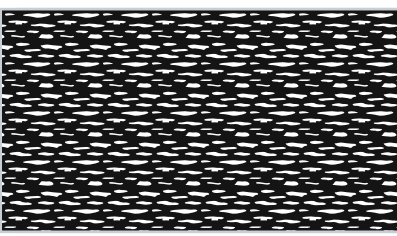

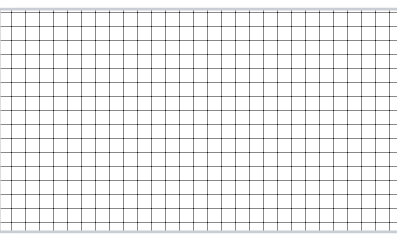

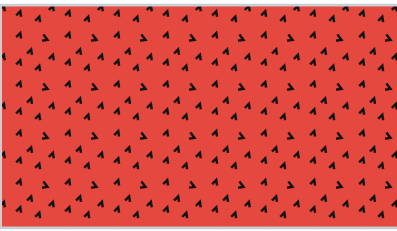

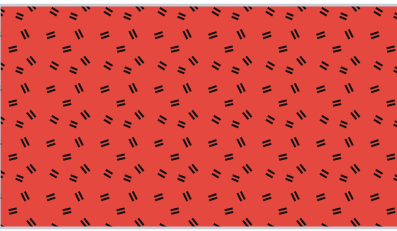

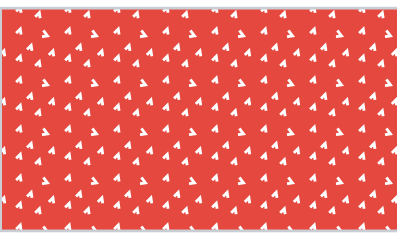

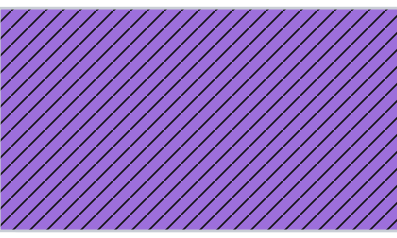

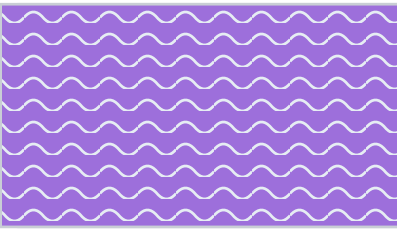

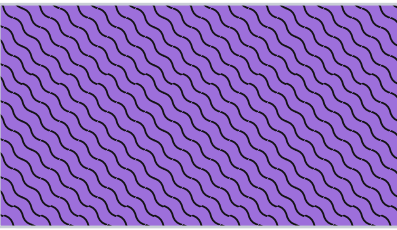

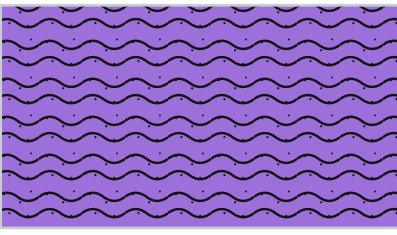

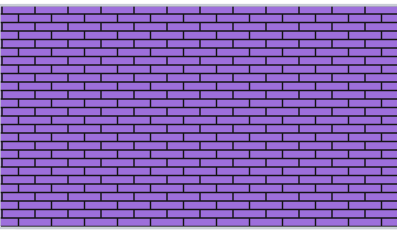

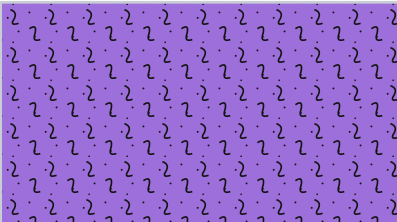

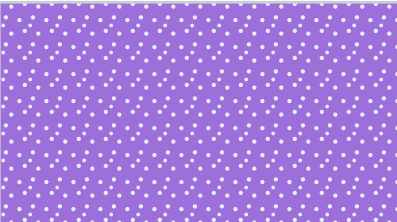

Resolution priority (first match wins): 1) USCS symbol 2) legend code 3) full/verbose USCS name 4) parenthetical symbol e.g. "FAT CLAY (CH)" 5) rock keyword 6) soil description parse 7) unknown.

Soil parse: with "with", dominant = phrase before "with", fines qualifier after (clean gravel/sand + clay/silt -> borderline dual, e.g. "poorly graded gravel with clay" -> GP-GC); no "with" -> dominant = last noun ("gravelly sand" -> SP). "Desc. keywords" applies to rock only.
